

when the meter number is inputed the name on the meter should show for confirmation. Im guessing thats the apis job

The balance is showing zero instead of the actuall balance and it happens not only here but on some other vtu products.

And now for the vtu and smm products LISTEN UP CAREFULLY. FIRSTLY, THERE HAS BEEN NO CHANGE TO THE RECEIPT PAGE AND IM GUESSING MAYBE DEBUG=TRUE on production server check

if this is true and change that. And if this is not the issue I want you to make the whole process look like this:
1. The customer picks what they want and input their pin
2. The request is immediately sent to the api for processing, while processing is happening a loading screen is showing (could be a doughnut loading bar) and customers wait for the response.
3. When processing is done and the api has either a successful or failed response which ever it is, is displayed to the customer.

And if this has already been done then check the debug value on prod server om guessing it is true and giving a mock response showing order processing and saying nothing else.
